DETAILED ACTION

Claim Rejections - 35 USC § 102

1. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

2. Claims 1, 2, 4-13 are rejected under 35 U.S.C. 102(b) as being anticipated by Muller (US 5,576,623).

3. As regards to claim 1, applicants attention is directed to figures 1-4 of Muller teaching a magnetic resonance imaging device, including a main magnet system for generating a steady magnetic field in a measuring space of the device; a gradient coil system; and a active shielding device assigned to the main magnet system (figure 4; column 7, line 57 to column 8, line 17).

4. As regards to claims 2 and 4-13, Muller further teaches linear electrical circuit(s) connected to the gradient system as an insulated and active shielding device and flexibly attaches to the bore hole of the system (column 6-7).

Claim Rejections - 35 USC § 103

5. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

6. Claims 3 and 14-17 are further rejected under 35 U.S.C. 103(a) as being unpatentable over Muller (US 5,576,623) as applied to claim 1 above, and further in view of Mansfield (US 5,990,680).

7. As regards to claims 3 and 4-17, Muller is silent teaching vibrations of the magnet and their measurement, the error correction unit driving the active shield as a feedback system using gradient coil current with different magnitude and phase shift. Mansfield teaches vibrations of the magnet and their measurement, the error correction unit driving the active shield as a feedback system using gradient coil current with different magnitude and phase shift.(figure 17, column 21-23). It would have been obvious for one having ordinary skill in the art at the time the invention was made to adapt the teaching of Mansfield as stated above with the teaching of Muller to improve image quality.
